ENGINEERING OVERVIEW

API Doc Summariser Agent

An agent that keeps integration guides current by reading the source API references and changelogs directly.

Claude

Python

MCP + GitHub

Days

to hours for integration ramp-up

Auto

breaking-change detection on every run

Zero

doc drift from the codebase

PR

delivery via GitHub pull request

THE PROBLEM

API docs drift from the code and nobody has time to fix them

Internal API docs drift from the code, and engineers lose days reverse-engineering references and spotting breaking changes by hand.

API References

Endpoints and parameters that diverged from the code

Changelogs

Release notes no one converts into readable guides

Integration Guides

Docs written once, never updated with breaking changes

Consumer Teams

Engineers who have to work out the diff by hand

Days

lost to reverse-engineering
undocumented API changes per integration

Docs

behind the code

Breaking

changes undiscovered

No per-team

integration guides

"We found out about the breaking change after we deployed. The changelog existed — nobody had time to read it and translate it into what it meant for us."

— Composite engineering team feedback

HOW IT WORKS

Four steps, from source repo to current integration guide

01

Crawl

The agent crawls internal API references and changelogs directly from the repos via MCP.

API refs

Changelogs

Version history

Repo crawl

02

Extract

Endpoints, parameters and version deltas are extracted into a structured model for each API.

Endpoints

Parameters

Version delta

03

Draft

Claude drafts a readable integration guide tailored to each consumer team's context.

Guide draft

Consumer context

Structured output

04

Flag

Breaking changes are flagged with impact notes and delivered via GitHub PRs and issues to affected teams.

PR delivery

GitHub issues

Impact notes

KEY FEATURES

Four capabilities that earn their place

No manual doc work. Every feature keeps the guides as current as the code.

1

Automated Crawl of Refs and Changelogs

The agent crawls API references and changelogs from source repos on every run — no manual sync needed.

API refs

Changelogs

Version diffs

Scheduled

2

Auto-Drafted Integration Guides per Consumer

A readable integration guide is drafted for each consumer team — written in their context, not generic reference prose.

Per-team guide

Consumer context

3

Breaking-Change Detection with Impact Notes

Version diffs are analysed for breaking changes. Each one gets an impact note explaining what downstream teams need to change.

Impact notes

Actionable

4

GitHub-Native Delivery via PRs and Issues

Guides are opened as PRs for review. Breaking-change alerts arrive as issues assigned to the affected teams.

PR delivery

Issue alerts

ARCHITECTURE

A Python agent on the Claude API, with MCP connectors into GitHub for source access and delivery

SOURCES (GitHub MCP)

API references

Changelogs

Version history

Release tags

PROCESSING (Python agent)

Repo crawl

Endpoint extraction

Version delta

Structure model

GENERATION (Claude API)

Guide drafting

Breaking-change flag

Impact notes

Consumer targeting

DELIVERY

Integration guide PR · Breaking-change issue · Impact notes · Assigned to affected team

RESULTS & IMPACT

Three numbers that justify the build

Days

to hours for integration ramp-up

Docs that

track the code instead of drifting

Caught

breaking changes before they reach consumers

What this unlocks

- Engineers integrate against guides that reflect the current code
- Breaking changes surface with impact notes, not raw diffs to decode
- Consumer teams receive GitHub issues assigned directly to them
- Guides are PRs — reviewable, versioned and merged into the repo
- Zero manual effort to keep docs in sync with a moving codebase

“The breaking-change notice came as a GitHub issue two days before the release. That’s the first time we’ve ever had that.”

— Composite consumer team engineering feedback

Your turning point in the AI era.

**Docs that track the code.
Guides that write themselves.
Breaking changes caught early.**

The API Doc Summariser crawls source repos, drafts current integration guides and flags breaking changes — delivered as GitHub PRs and issues to the teams that need them.

Thank you.
