PRODUCT OVERVIEW

Requirement-to-Dashboard Pipeline

A pipeline that converts messy stakeholder notes into a structured BRD and a first-pass dashboard spec ready for review.

Claude Projects

Clay + HubSpot

BigQuery

~50%

requirement-to-dashboard cycle reduction

One

BRD generated per project from raw notes

Zero

charts built before requirements are clear

Full

metric-to-requirement traceability

THE PROBLEM

Half the project is spent before building starts

Analysts spend the front half of every project translating vague stakeholder notes into requirements and a dashboard plan — before any building starts.

Stakeholder Notes

Vague meeting notes with no structure or owner

Source Tables

Tables shared with no context on what's needed

Dashboard Briefs

Dashboard briefs written from memory, not requirements

Rebuild Requests

Rebuild requests because the spec was never pinned

Days of project time spent
before a single chart is built

No structured

requirements doc

Metrics

without sources

Rebuild

loops with stakeholders

"We start building before we've really nailed the requirements. Then we rebuild. Every project has this loop, and it's always avoidable."

— Composite analytics lead feedback

HOW IT WORKS

Four steps, from raw notes to a reviewable dashboard spec

01

Ingest

Raw stakeholder notes and available source tables are ingested from Clay, HubSpot and BigQuery into Claude Projects.

Stakeholder notes

Meeting transcripts

Source tables

Clay + HubSpot

02

Structure

Claude structures the notes into a business requirements document — goals, metrics, dimensions and acceptance criteria.

Goal extract

Metric map

Dimension list

03

Scaffold

A BI dashboard spec is scaffolded: metrics, dimensions, chart types and a proposed layout — ready for analyst review.

Dashboard spec

Chart types

Layout draft

04

Analyse

A first-pass exploratory data analysis runs on the source tables to surface distributions, nulls and candidate joins.

EDA report

Null check

Join candidates

ARCHITECTURE

Claude Projects for persistent context, with connectors to Clay, HubSpot and BigQuery for source data

SOURCES (Connectors)

Stakeholder notes

Clay contacts

HubSpot CRM

BigQuery tables

CONTEXT (Claude Projects)

Persistent context

Source awareness

Session memory

Iteration support

OUTPUTS (BRD + Dashboard spec + EDA)

BRD document

Dashboard spec

EDA report

Traceability index

DELIVERY

Structured BRD · Dashboard spec · EDA first pass · Metric-to-requirement traceability

KEY FEATURES

Four capabilities that earn their place

No building before the spec is right. Every feature shortens the loop between notes and chart.

1

Notes-to-BRD Structuring

Raw meeting notes and stakeholder inputs are structured into a business requirements document with goals, metrics, dimensions and acceptance criteria.

Goals

Metrics

Dimensions

Acceptance

2

Auto-Scaffolded Dashboard Spec

A BI dashboard spec is generated from the BRD — metrics, dimensions, chart types and a proposed layout — ready for analyst review before any building starts.

Chart types

Layout draft

3

First-Pass Exploratory Analysis

An EDA runs on the source tables: distributions, nulls, candidate joins and anomalies surfaced before the analyst touches the data.

Distributions

Null audit

4

Metric-to-Requirement Traceability

Every metric in the dashboard spec links back to the requirement and the stakeholder input that justified it — no orphan charts.

Linked back

No orphans

RESULTS & IMPACT

Three numbers that justify the build

~50%

reduction in requirement-to-dashboard cycle

Clearer

specs before a single chart is built

Fewer

rebuild loops with stakeholders

What this unlocks

- Analysts start building from a pinned spec, not guesswork
- Stakeholders review a structured BRD, not raw notes
- Every metric traces back to the requirement that justified it
- EDA surfaces data quality issues before the dashboard design starts
- Claude Projects retains context across the full project lifecycle

"We used to spend a week going back and forth on what the dashboard should even show. Now we agree on the BRD first and the build is clean."

— Composite analytics lead feedback

Your turning point in the AI era.

Notes in. BRD out. Dashboard spec ready.

The Requirement-to-Dashboard Pipeline structures what stakeholders actually need before any chart is built — so analysts build once and build right.

Thank you.
