BEFORE YOU START

How to read this playbook.

This playbook covers 100 AI tools across 10 categories — from the most established platforms to the newest connectors. Each card tells you what the tool actually is, how to use it in practice, and the specific situations where it delivers the most value. Tools are listed in chronological order within each category — older, well-established tools first, newer tools last — so you can see how the landscape has evolved and where the frontier currently sits.

TOOL TYPE BADGES

- Claude Native

Built directly into Claude — no setup required.
- Claude Connected

External tool linked to Claude via MCP connector.
- AI Tool

Standalone AI platform — works independently of Claude.

Start where your biggest friction is.
Do not read this front to back. Find the category that maps to your biggest time drain — writing, research, code, meetings — and start there. Pick two tools. Use them for a week. Then come back for the next category.

Every card is a decision, not a recommendation.
This playbook does not tell you what to use. It tells you what each tool does, how it works, and when it applies. The right tool depends on your workflow, your budget, and your level. Read the use cases and match them to your actual situation.

Claude connects most of this stack.
The majority of tools marked Claude Connected can be linked to Claude in under 60 seconds via Settings > Connectors. Once connected, Claude reasons across your tools simultaneously — the stack becomes more powerful as more of it is connected.

THE 10 CATEGORIES

01	Writing & Content	10 tools	From ChatGPT to Claude to Grammarly and Jasper
02	Research & Knowledge	10 tools	Perplexity, Claude Deep Research, Elicit, Consensus
03	Coding & Development	10 tools	GitHub Copilot, Cursor, Claude Code, Replit, Tabnine
04	Data & Analysis	10 tools	Julius, Hex, Claude, Tableau AI, Rows, Airtable
05	Image & Visual	10 tools	Midjourney, DALL-E, Stable Diffusion, Firefly, Canva
06	Audio & Voice	10 tools	Whisper, ElevenLabs, Descript, Otter, Riverside
07	Productivity & Automation	10 tools	Zapier, Notion AI, Reclaim, Motion, Claude Cowork
08	Learning & Education	10 tools	Khanmigo, Duolingo Max, Synthesis, Claude, Coursera
09	Business & Strategy	10 tools	HubSpot AI, Salesforce Einstein, Gamma, Claude, Tome
10	Agents & Workflows	10 tools	AutoGPT, Claude Agents, n8n, LangChain, Cowork

1	ChatGPT (GPT-4o)	AI Tool	Writing
What it is: OpenAI's general-purpose AI assistant, launched 2022, now on GPT-4o. The most widely used AI writing tool in the world, covering everything from emails to essays, summaries to scripts.			
How to use it: Go to chat.openai.com. Type your request directly — give it a task, a tone, and a target audience. Use the system prompt or custom instructions to set your role and preferred style. Iterate in the same conversation.			
Use cases: Drafting first versions of blog posts and newsletters. Writing cold emails with personalised hooks. Producing marketing copy across formats. Summarising long documents into executive briefs.			
2	Jasper AI	AI Tool	Writing
What it is: Purpose-built AI writing platform for marketing teams, launched 2021. Specialises in brand-voice consistency, campaign copy, and high-volume content production with templates for every marketing format.			
How to use it: Set up your brand voice profile with tone, vocabulary, and style guidelines. Choose a template (blog post, ad copy, email sequence, social caption). Give Jasper the brief and let it produce multiple variations for testing.			
Use cases: Generating dozens of ad copy variants for A/B testing. Producing on-brand social content at scale. Writing product descriptions for large e-commerce catalogues. Creating email sequences for marketing campaigns.			
3	Grammarly	AI Tool	Writing
What it is: AI writing assistant launched 2009, now with a full generative layer. Checks grammar, clarity, tone, and style in real time. Works as a browser extension, desktop app, and API integration across most writing surfaces.			
How to use it: Install the browser extension or desktop app. Write anywhere you normally write — Gmail, Docs, Notion, LinkedIn. Grammarly flags issues inline and suggests rewrites. The generative layer can draft, rewrite, or adjust tone on request.			
Use cases: Catching tone mismatches in client emails before sending. Improving clarity in long reports without losing technical accuracy. Ensuring consistency in style across a team writing shared documents. Adjusting formality of messages for different audiences.			
4	Copy.ai	AI Tool	Writing
What it is: AI content platform launched 2020, built for marketing and sales copy. Strong at short-form output — product descriptions, ad copy, CTAs, subject lines — and at running multi-step content workflows.			
How to use it: Select a workflow template or start from a blank canvas. Give Copy.ai your product, audience, and goal. It generates multiple variations. Use the workflow builder to chain prompts — research to draft to refine — in a single automated run.			
Use cases: Producing high volumes of product descriptions for e-commerce. Writing A/B test variants for email subject lines. Building end-to-end content workflows for social media. Generating sales email sequences with personalisation variables.			

5

Notion AI

AI Tool

Writing

What it is: AI writing layer built directly into Notion, launched 2023. Drafts, summarises, translates, rewrites, and extracts action items from content already in your Notion workspace — without leaving the page.

How to use it: In any Notion page, press the space bar or type /AI. Give it an instruction: write, summarise, improve, translate, extract action items. It works on the selected text or generates from scratch at the cursor position.

Use cases: Summarising meeting notes into action items inside the same page. Drafting project briefs from bullet point outlines. Rewriting rough draft sections for clarity. Translating documentation for international teams without leaving the workspace.

6

Claude — Writing

Claude

Writing

What it is: Claude's writing capability is the most reasoning-forward of any major AI writing tool. It argues, structures, and edits at the level of intent — understanding what you are trying to achieve and producing writing that serves that goal, not just the prompt.

How to use it: Give Claude a clear brief: the topic, the audience, the desired outcome, the length, and any constraints (tone, what to avoid, what to include). Ask it to rewrite drafts rather than generate from scratch when you want something that preserves your voice.

Use cases: Writing long-form pieces that require logical argument rather than just information. Producing difficult communications — feedback, negotiation, complaints — where tone is as important as content. Rewriting existing drafts to improve clarity, confidence, or concision. Adapting one piece of content for multiple audiences or channels.

7

Writesonic

AI Tool

Writing

What it is: AI writing platform launched 2020, with a strong emphasis on SEO-optimised content and factual accuracy. Integrates with Surfer SEO for real-time optimisation and supports long-form article generation with cited sources.

How to use it: Select an article type and input your keyword and brief. Writesonic generates a structured outline first — review and adjust it before generating the full piece. Use the Surfer integration to optimise for search intent as you write.

Use cases: Writing SEO-optimised blog articles with keyword targeting built in. Producing fact-checked long-form content with source citations. Creating product landing pages optimised for search. Generating topic clusters and content calendars from a seed keyword.

8	Hemingway Editor	AI Tool	Writing
What it is: Writing clarity tool that highlights sentences that are hard to read, overuse of adverbs, passive voice, and unnecessary complexity. Not a generative AI — it is a diagnostic layer that tells you where your writing is unclear.			
How to use it: Paste your text into hemingwayapp.com . Read the colour-coded highlights: red for hard-to-read sentences, yellow for complex, blue for adverbs, green for passive voice. Rewrite the highlighted sections until the readability score improves.			
Use cases: Editing technical documentation to be readable by a non-expert audience. Improving the clarity of client-facing reports before delivery. Simplifying investor updates so every reader gets the key message. Training yourself to write more clearly by seeing your patterns over time.			
9	Wordtune	AI Tool	Writing
What it is: AI rewriting tool launched 2020 that rewrites sentences and paragraphs in different tones and styles — not replacing your ideas, but finding better ways to express them. Strong at sentence-level improvement rather than full-document generation.			
How to use it: Install the Wordtune browser extension or use the web app. Highlight a sentence or paragraph. Click the Wordtune icon to see alternative phrasings — casual, formal, shorter, longer, or rephrased. Select the version that fits best.			
Use cases: Finding a better way to open an email that does not land right. Rewriting a single sentence that is grammatically correct but awkward. Adjusting the tone of a proposal section without rewriting the whole thing. Getting unstuck when you know what you want to say but cannot find the words.			
10	Claude — Document Analysis	Claude	Writing
What it is: Upload any PDF, contract, report, or multi-document set and ask Claude to analyse, compare, summarise, extract, or explain. Claude holds the full document in context and reasons across the whole thing simultaneously.			
How to use it: Upload the document in the Claude conversation. Ask a specific question rather than a general one — "what are the payment terms in clause 4" produces better output than "summarise this". For multiple documents, upload all of them and ask Claude to compare or cross-reference.			
Use cases: Reviewing a contract for risk clauses before signing. Extracting all action items and deadlines from a 50-page report. Comparing two versions of a proposal to identify what changed. Explaining technical documentation in plain language for a non-expert decision-maker.			

11 Perplexity AI

AI Tool

Research

What it is: AI-powered search engine launched 2022. Answers questions with cited sources in real time, combining web search with a large language model. Every answer includes direct citations so you can verify the source immediately.

How to use it: Go to perplexity.ai. Type your question as you would ask a knowledgeable person, not as a search query. Use the Focus feature to restrict search to academic papers, news, YouTube, or Reddit. Ask follow-up questions in the same thread to go deeper.

Use cases: Getting a sourced answer to a factual question without reading ten search results. Researching a company or person before a meeting with citations to verify. Finding recent news on a fast-moving topic with sources attached. Summarising what is known about a technical concept from academic sources.

12 Elicit

AI Tool

Research

What it is: AI research assistant launched 2021, built specifically for academic and scientific research. Searches and summarises academic papers, extracts key findings, and helps you build literature reviews without reading every paper in full.

How to use it: Go to elicit.com. Enter a research question in natural language. Elicit searches academic databases and returns a table of relevant papers with extracted data — population, method, outcomes. Ask it to summarise findings or identify gaps across all results.

Use cases: Building a literature review on a research topic efficiently. Finding the evidence base behind a health or scientific claim before acting on it. Identifying which academic studies support or contradict a specific hypothesis. Preparing for a deep-expertise conversation by understanding the current state of research.

13 Consensus

AI Tool

Research

What it is: AI research tool launched 2022 that searches peer-reviewed papers and provides a consensus meter — showing how much agreement exists across studies on a specific question. Answers are grounded exclusively in published research.

How to use it: Go to consensus.app. Ask a yes/no or comparative research question. Consensus shows the percentage of papers that support, oppose, or find mixed evidence. Click into individual studies for the full abstract and citation.

Use cases: Checking whether a health or nutrition claim has scientific backing. Understanding the research consensus on a business or psychological principle. Preparing an evidence-based argument for a specific position. Verifying a claim made in a report or presentation before repeating it.

14 Claude — Web Search

Claude

Research

What it is: Claude's built-in web search retrieves current information and synthesises it directly in the conversation. Unlike a search engine, it reads the sources and gives you a synthesised answer with citations rather than a list of links to visit.

How to use it: In any Claude conversation, ask a question that requires current information. Claude will search automatically when the question needs up-to-date data. For more control, say "search for X and give me a summary with sources". Ask follow-up questions to go deeper on any source.

Use cases: Finding the current price, status, or version of something that changes frequently. Researching recent news on a topic before a meeting or decision. Verifying whether a fact from memory is still accurate. Getting a sourced overview of a company, product, or person you are about to engage with.

15 You.com

AI Tool

Research

What it is: AI search engine launched 2021 with a personalised, multi-source approach. Aggregates results from web, code, academic papers, and social sources. Has a Research mode that produces detailed multi-source reports on complex questions.

How to use it: Go to you.com. Use the standard search for quick answers or switch to Research mode for a more comprehensive, cited report. Configure which sources to include — web, academic, news, or Reddit. Ask follow-up questions to narrow or expand the report.

Use cases: Getting a comprehensive research report on a market, technology, or topic. Comparing multiple perspectives on a contested question from different source types. Researching a technical concept with code examples alongside explanations. Building a briefing document on a topic without switching between multiple search tools.

16 NotebookLM

AI Tool

Research

What it is: Google's AI research notebook launched 2023. You upload your own sources — PDFs, documents, Google Docs — and NotebookLM reasons exclusively over those sources to answer questions, create summaries, and generate podcasts from your material.

How to use it: Go to notebooklm.google.com. Upload your sources — research papers, reports, notes, transcripts. Ask questions about your specific uploaded material. Use the Audio Overview feature to generate a podcast-style conversation summarising your sources.

Use cases: Deep-diving into a set of reports or papers without reading every one. Building a custom knowledge base for a specific project that Claude can query. Preparing for an exam or presentation by synthesising your own notes and source materials. Converting a stack of research documents into an audio summary for listening while commuting.

17	Claude — Deep Research	Claude	Research
What it is: Claude's Deep Research mode runs extended, multi-source research sessions — searching dozens of sources, cross-referencing claims, identifying gaps, and producing a structured report. It is the AI equivalent of a research analyst, not a faster search.			
How to use it: In Claude, type your research question and add "using deep research" or enable it from the tools menu. Claude will run the research session, which takes several minutes. Review the structured report with citations. Ask follow-up questions to drill into any section.			
Use cases: Building a comprehensive market analysis before a business decision. Producing an evidence-based report on a complex topic for an investor or board presentation. Researching a regulatory, legal, or technical landscape before entering a new domain. Understanding the competitive environment in a new market in depth.			
18	Tavily	AI Tool	Research
What it is: AI-optimised search API launched 2023, designed specifically for use by AI agents and applications. Returns structured, clean search results that AI models can process directly — the research backbone behind many AI agent workflows.			
How to use it: Integrate Tavily via its API into your AI application or agent workflow. Set the search depth (basic or advanced), the topic type (general or news), and the max results. The API returns structured JSON that your AI can reason over directly without scraping raw HTML.			
Use cases: Powering the web search capability in a custom AI agent or application. Giving an AI workflow access to current information without building your own scraping infrastructure. Grounding LLM outputs in real-time web data. Building a research pipeline where an AI searches, synthesises, and reports automatically.			
19	Kagi Search	AI Tool	Research
What it is: Premium, ad-free search engine with an AI summarisation layer launched 2023. Returns cleaner, higher-quality results by deprioritising SEO-gamed content. The Universal Summarizer creates instant summaries of any URL.			
How to use it: Go to kagi.com (subscription required). Search normally for higher-quality results. Use the Universal Summarizer by prepending "sum:" to any URL. Use FastGPT for immediate AI-synthesised answers. Personalise your result rankings by promoting or blocking specific domains.			
Use cases: Researching topics where SEO-heavy content dominates Google results and obscures quality information. Getting an instant summary of any long article or report via URL. Conducting research without ads or tracking influencing the result ranking. Finding high-quality, authoritative sources on technical or academic topics.			

20	Claude — Research Synthesis	Claude	Research
What it is: Paste multiple sources, articles, or documents and Claude synthesises across all of them simultaneously — finding agreement, contradiction, and gaps that no single source reveals. The output reflects the total picture, not a series of individual summaries.			
How to use it: Paste all your source material into one Claude conversation. Then ask a synthesis question: "what do all these sources agree on", "what do they contradict", "what question do none of them answer". Ask Claude to produce a structured synthesis report with a confidence assessment for each claim.			
Use cases: Consolidating research from ten sources into one coherent briefing before a decision. Identifying where expert sources disagree and understanding why. Building a literature synthesis that goes beyond summarising each source separately. Cross-checking a report's claims against multiple independent sources before presenting.			
21	Tabnine	AI Tool	Coding
What it is: One of the earliest AI code completion tools, launched 2018. Runs locally or in the cloud, integrates with all major IDEs, and provides inline code suggestions as you type. Strong emphasis on privacy — can run entirely on-device.			
How to use it: Install the Tabnine plugin for your IDE (VS Code, IntelliJ, Vim, etc.). Start typing and Tabnine completes your code inline. For teams, connect it to your codebase to learn your patterns and style. Accept suggestions with Tab, dismiss with Escape.			
Use cases: Speeding up boilerplate code writing in any language. Getting inline completions that match your team's coding patterns. Running AI code assistance on sensitive codebases without sending code to external servers. Reducing typos and syntax errors in routine code.			
22	GitHub Copilot	AI Tool	Coding
What it is: Microsoft and OpenAI's AI code assistant launched 2021. The most widely adopted AI coding tool, integrated directly into VS Code and all major IDEs. Suggests full functions, explains code, writes tests, and now includes an agent mode for multi-file edits.			
How to use it: Install the GitHub Copilot extension in your IDE. Write a comment describing what you want and Copilot generates the code below it. Use Copilot Chat to ask questions about your code or request specific changes. Agent mode lets you describe a larger task and Copilot makes changes across multiple files.			
Use cases: Generating a complete function from a descriptive comment. Writing unit tests for existing code automatically. Getting an explanation of unfamiliar code from a legacy codebase. Making a refactor across multiple files with a single natural language instruction.			

23

Cursor

AI Tool

Coding

What it is: AI-first code editor launched 2023, built on VS Code. Cursor is not a plugin — it is a full IDE where AI is the core interface. It can edit multiple files simultaneously, understand your entire codebase, and generate production-ready code from a description.

How to use it: Download Cursor at cursor.sh. Open your project. Use Cmd+K for inline edits, Cmd+L for the chat panel to discuss your codebase. Use Composer for multi-file changes from a single instruction. Connect your codebase to give Cursor full context across all files.

Use cases: Building a new feature from a plain-English description across multiple files. Understanding how a large unfamiliar codebase works before making changes. Refactoring a complex module while maintaining all existing tests. Making consistent changes across many files simultaneously.

24

Replit AI

AI Tool

Coding

What it is: AI coding environment launched 2023 as the AI layer inside Replit's browser-based IDE. Lets non-developers build and deploy working applications from plain English descriptions without setting up a local development environment.

How to use it: Go to replit.com. Describe the application you want to build. Replit AI generates the initial code and deploys it immediately. Iterate by describing changes in natural language — "make the button blue", "add a login page". Everything runs in the browser.

Use cases: Building a working prototype without a local development setup. Creating internal tools — dashboards, simple apps — as a non-developer. Testing an app idea quickly before investing in proper development. Teaching yourself to code by seeing working code generated from your descriptions.

25

Claude Code — Terminal

Claude

Coding

What it is: Claude's command-line agentic coding tool. It reads your actual codebase, writes code, runs tests, makes commits, and executes terminal commands autonomously — acting on your project rather than generating snippets for you to paste.

How to use it: Install via npm: `npm install -g @anthropic-ai/claude-code`. Run "claude" in your project directory. Describe the task you want done. Claude reads your files, makes changes, runs tests, and iterates. Review diffs before committing or let it run autonomously.

Use cases: Implementing a new feature end-to-end without writing code manually. Running a comprehensive code review and applying all suggested fixes automatically. Debugging a failing test by tracing the root cause across multiple files. Migrating a codebase from one framework or version to another.

26	Claude Code — VS Code	Claude	Coding
What it is: Claude Code as a VS Code extension — bringing the full agentic coding capability into the editor. Claude sees your open files, your terminal, and your error messages. It edits code inline and runs actions without switching windows.			
How to use it: Install the Claude Code extension from the VS Code marketplace. Open your project. Claude appears in the sidebar and can see all open files. Select code and ask Claude to explain, refactor, or fix it. Describe a larger task and Claude plans and executes it across files.			
Use cases: Getting an explanation of a complex function while reading it. Refactoring a class or module while staying in the editor. Fixing a compiler error with full file context rather than copying the error into a chat window. Writing documentation for a function directly in the file.			
27	Claude Code — JetBrains	Claude	Coding
What it is: Claude Code as a JetBrains IDE plugin — available in IntelliJ, PyCharm, WebStorm, and other JetBrains products. Same full agentic capability as the VS Code version, built for the enterprise Java, Python, and Kotlin development environments.			
How to use it: Install the Claude Code plugin from the JetBrains marketplace. Open your project. Access Claude from the tool window or via keyboard shortcut. Give it a task that involves your open project and it reads your files, makes edits, and runs your build tools.			
Use cases: Implementing features in Spring Boot or Django projects without context switching. Running refactors across a large Java codebase with full type awareness. Writing and running tests for existing backend code automatically. Onboarding onto a large enterprise codebase by asking Claude to explain its architecture.			
28	Codeium	AI Tool	Coding
What it is: Free AI code completion and chat tool launched 2022. Supports 70+ languages, integrates with all major IDEs, and provides both inline completion and a chat interface for code questions. Strong alternative to GitHub Copilot for individuals and smaller teams.			
How to use it: Install the Codeium extension for your IDE. Start coding and accept inline completions with Tab. Use the chat panel to ask questions about your code, request rewrites, or get explanations of unfamiliar code. Use Codeium Command for inline natural language edits.			
Use cases: Getting free AI code assistance for personal projects or open source work. Generating completions across multiple programming languages in the same workflow. Asking questions about a library or API without leaving your editor. Getting inline refactor suggestions as you write rather than requesting them separately.			

29	GitHub — Claude Connected	Connected	Coding
What it is: GitHub's MCP connector lets Claude access your repositories, pull requests, issues, and commit history directly in conversation. Claude can review code, trace function evolution, generate release notes, and flag PR issues — with full repository context.			
How to use it: Connect via Settings > Connectors in Claude.ai. Search GitHub and authenticate. Then ask Claude: "review the latest PR in [repo]", "generate release notes from this week's commits", or "explain why this function changed across these three commits". Claude reads the actual code, not a description of it.			
Use cases: Reviewing pull requests at the architecture level before formal review. Generating accurate release notes from commit history automatically. Understanding how a codebase has evolved before making a major change. Identifying which tickets are blocked and why across multiple repositories.			
30	Devin	AI Tool	Coding
What it is: The first fully autonomous AI software engineer, launched by Cognition in 2024. Devin can receive a software task, plan it, write code, run tests, debug, and deploy — operating a full development environment without human intervention at each step.			
How to use it: Assign Devin a task in plain English via the Cognition platform or Slack. Devin creates a plan, opens its own browser and terminal, writes and executes code, and reports back. You can observe and redirect at any point. Best used for well-defined, bounded engineering tasks.			
Use cases: Implementing a defined feature from a spec without engineering oversight at each step. Running a code migration task — updating a library version across a large codebase. Building a simple web application from a requirements document. Completing a well-defined bug fix with test coverage without using an engineer's time.			
31	Tableau AI	AI Tool	Data
What it is: AI layer built into Tableau, one of the oldest and most established BI platforms (Tableau launched 2003, AI features from 2023). Einstein Copilot for Tableau lets users create and edit visualisations using natural language without learning Tableau's query language.			
How to use it: Open an existing Tableau workbook or connect a data source. Use the Ask Data feature to type a question in plain English — "show me monthly revenue by region". Tableau generates the visualisation. Use Explain Data to get AI explanations of why a data point is anomalous.			
Use cases: Non-technical managers exploring data without building charts manually. Getting an instant explanation of why a KPI moved unexpectedly. Creating a quick visualisation for a presentation without a data analyst's help. Exploring a new dataset to understand its structure before deciding how to analyse it.			

32	Julius AI	AI Tool	Data
What it is: Conversational data analysis tool launched 2023. Upload a CSV, Excel file, or database and ask questions about it in plain English. Julius generates charts, runs statistical analyses, writes Python or R code to produce results, and explains findings in plain language.			
How to use it: Go to julius.ai . Upload your data file. Ask questions: "what is the average sale by region", "show me the trend in monthly signups", "which product has the highest return rate". Julius produces charts, tables, and written explanations. Download the analysis or the generated code.			
Use cases: Analysing a CSV from a CRM export without Excel skills. Getting statistical insights from a dataset in minutes without writing code. Producing charts for a presentation from raw data without using a BI tool. Letting a non-analyst explore business data independently.			
33	Hex	Connected	Data
What it is: Business intelligence and data science notebook launched 2021. Teams build data apps and analytical reports collaboratively. The Claude connector lets you query Hex projects in plain English and get results explained in language business stakeholders can act on.			
How to use it: Connect Hex via Settings > Connectors. Ask Claude to query your Hex data models in plain language. Claude runs the analysis and returns results with a plain-English explanation. For direct use, open Hex and use the AI-assisted cell generation to build analyses faster.			
Use cases: Bridging data team output and business stakeholder understanding. Getting a plain-language explanation of what a complex data model is showing. Running ad hoc analyses on live data without building a new dashboard. Allowing non-technical leaders to ask data questions and get real answers.			
34	Airtable AI	Connected	Data
What it is: AI layer built into Airtable (launched 2012, AI from 2023). Airtable's structured database becomes conversational via the Claude connector — query across tables, summarise records, and extract insights from your operational data in natural language.			
How to use it: Connect Airtable via Settings > Connectors in Claude. Ask Claude questions about your Airtable data: "which projects are overdue", "summarise all records tagged high priority", "compare the metrics across these campaigns". For direct use, Airtable's native AI can summarise and categorise records inside the app.			
Use cases: Querying a product roadmap database in plain language. Summarising a large CRM or content calendar without building a custom view. Getting cross-table insights from a linked Airtable database. Asking operational questions about structured data without needing a filter or formula.			

35	Rows	AI Tool	Data
What it is: AI-native spreadsheet launched 2022 that connects to live data sources and includes built-in AI for analysis. Unlike traditional spreadsheets, Rows can pull live data from APIs, run AI analysis on it, and generate charts — without leaving the spreadsheet.			
How to use it: Go to rows.com. Create a new spreadsheet and connect a data source — Stripe, HubSpot, Google Analytics, or a custom API. Use the AI Analyst feature to ask questions about your data in natural language. Generate charts and summaries directly from live data.			
Use cases: Building a live revenue dashboard connected directly to Stripe data. Analysing marketing campaign performance from live HubSpot data. Creating a startup metrics spreadsheet that pulls real-time data without manual exports. Generating an AI-written analysis of your business data on a weekly schedule.			
36	Amplitude — Claude Connected	Connected	Data
What it is: Product analytics platform launched 2012, now connected to Claude via MCP. Tracks user behaviour, funnels, feature adoption, and retention. The Claude connector makes this data conversational — you ask in plain English and Claude answers from your actual Amplitude data.			
How to use it: Connect Amplitude via Settings > Connectors. Ask Claude: "what is the drop-off rate in our signup funnel", "which features have the highest 30-day retention", "why did DAU fall last Tuesday". Claude queries your Amplitude data and explains the finding in plain language with context.			
Use cases: Identifying exactly where users drop off in a product flow without building a custom chart. Understanding which features drive retention and which are unused. Getting a plain-language explanation of a sudden metric change. Preparing a product insight for a stakeholder meeting in minutes from live data.			
37	Stripe — Claude Connected	Connected	Data
What it is: Payment and billing infrastructure launched 2011, now connected to Claude via MCP. The connector lets Claude query your live Stripe revenue data — MRR, churn, refund patterns, plan distribution — in plain English without exporting anything.			
How to use it: Connect Stripe via Settings > Connectors. Ask Claude: "what is our MRR this month vs last", "which plan has the highest churn", "show me all failed payments in the last 7 days". Claude queries your actual Stripe account and produces a synthesised answer.			
Use cases: Getting a daily revenue summary without building a dashboard. Understanding which pricing tier is losing the most customers. Investigating a revenue drop by asking Claude to find the pattern in the billing data. Preparing a financial update for a board meeting from live Stripe data.			

38 Claude — Spreadsheet and Formula

Claude

Data

What it is: Claude writes, debugs, and explains spreadsheet formulas for Excel, Google Sheets, and Airtable. Describe what you want to calculate in plain English and Claude produces the exact formula, explains how it works, and helps debug it when it breaks.

How to use it: Describe your data structure and what you want to calculate: "I have dates in column A and sales in column B — I want to sum sales in the last 30 days". Claude writes the formula. If a formula is broken, paste the formula and the error and Claude diagnoses and fixes it.

Use cases: Building complex multi-condition SUMIFS or COUNTIFS without spending time on syntax. Debugging a formula that returns an error you cannot identify. Creating a dynamic date-based calculation that updates automatically. Understanding what a formula written by someone else actually does.

39 Claude — Data Report Writing

Claude

Data

What it is: Paste any raw data, table, or metric set and ask Claude to write a structured report — executive summary, key findings, analysis, and recommendations. Claude adapts the structure and language to the specific audience you name.

How to use it: Paste the data or table and tell Claude: the audience (board, team, client), the purpose (weekly review, investor update, post-mortem), and any specific angle to cover. Claude produces a full report. Ask it to revise sections, change the tone, or add specific comparisons.

Use cases: Writing a weekly data review for leadership from raw metrics. Turning a dashboard screenshot into a written analysis. Producing a post-launch report from a set of product metrics. Writing an investor update from financial data without spending an afternoon on it.

40 Clay — Claude Connected

Connected

Data

What it is: Data enrichment and prospecting platform launched 2021. Clay pulls and enriches firmographic and contact data from dozens of sources. The Claude connector lets you ask analytical questions about your enriched data — identifying patterns, prioritising accounts, and surfacing insights.

How to use it: Connect Clay via Settings > Connectors. Ask Claude to analyse your enriched prospect data: "which accounts have the profile most similar to our best customers", "what industry has the highest conversion in our data", "rank these accounts by fit score". Claude reasons over your Clay data and produces prioritised recommendations.

Use cases: Identifying which prospect segments to prioritise based on enriched firmographic data. Finding patterns in closed-won data to define the ideal customer profile. Prioritising a long list of accounts before an outbound campaign. Generating targeted outreach lists from Clay data with Claude's reasoning applied.

41	DALL-E 3	AI Tool	Visuals
What it is: OpenAI's image generation model, now on version 3. Accessible directly in ChatGPT, it generates images from text descriptions with strong prompt adherence — producing images that match detailed instructions more accurately than earlier models.			
How to use it: In ChatGPT (Plus or above), describe the image you want in detail — subject, style, composition, lighting, mood, colour palette. DALL-E 3 generates four options. Request variations or specific edits in follow-up messages. Use GPT-4o's vision input to show a reference image and ask for something similar.			
Use cases: Generating concept art for a product, brand, or campaign. Creating custom illustrations for blog posts or presentations without a designer. Producing social media visuals from a brief. Exploring visual directions for a brand or project before committing to a direction.			
42	Midjourney	AI Tool	Visuals
What it is: The most artistically capable AI image generation tool, launched 2022. Produces consistently high-quality, aesthetically sophisticated images. Operates via Discord commands (or the web interface from 2024). Known for photorealistic and painterly styles that outperform most other models.			
How to use it: Join the Midjourney Discord or go to midjourney.com. Type /imagine followed by your prompt. Use parameters: --ar for aspect ratio, --style raw for less processing, --v 6 for the latest model. Study the prompt syntax — lighting, camera type, and style references dramatically change the output.			
Use cases: Producing hero images for marketing campaigns with a distinctive visual style. Creating concept art for a product or environment. Generating photorealistic lifestyle imagery for a brand without a photoshoot. Exploring visual identity directions for a new brand or product line.			
43	Stable Diffusion	AI Tool	Visuals
What it is: Open-source image generation model launched 2022 by Stability AI. Runs locally or in the cloud, fully customisable, and powers thousands of specialised applications through its open weights. The most flexible and extensible image AI, but with a steeper learning curve.			
How to use it: Use via Automatic1111 or ComfyUI for local deployment, or via Stability AI's API. Download specialised checkpoints (models) and LoRAs (fine-tunes) from CivitAI for specific styles. Use the txt2img and img2img pipelines. ControlNet lets you control composition using sketches or poses.			
Use cases: Building a custom image generation pipeline for a specific visual style. Fine-tuning a model on your brand's visual language for consistent output. Running image generation at scale without per-image API costs. Generating images with precise compositional control using ControlNet.			

44	Adobe Firefly	AI Tool	Visuals
What it is: Adobe's generative AI platform launched 2023, integrated into Photoshop, Illustrator, and Adobe Express. Trained exclusively on licensed and public domain content, making its output commercially safe. Specialises in editing existing images rather than generating from scratch.			
How to use it: Access in Photoshop via the Generative Fill tool — select an area and describe what to place there. In Adobe Express, use the text-to-image feature to generate assets for templates. In Illustrator, use Generative Recolor to apply AI-powered colour variations to vector art.			
Use cases: Extending an image beyond its original borders with generative fill. Removing and replacing specific elements in a product photo. Creating colour variations of a brand asset without manual redesign. Adding a background to a product image with a specific scene description.			
45	Canva AI — Claude Connected	Connected	Visuals
What it is: Canva's AI layer, launched as Magic Studio 2023, is accessible inside Claude via MCP connector. Claude can create designs using your Canva brand kit, generate copy matched to templates, resize designs across formats, and export assets — from a single Claude conversation.			
How to use it: Connect Canva via Settings > Connectors. Ask Claude to create a specific design: "create an Instagram post for [product] using our brand kit". Claude uses your Canva brand assets and templates. For direct use, open Canva and use Magic Write for copy and Magic Design for layout generation.			
Use cases: Producing a week of social content using existing brand assets. Creating presentation slides from a content brief. Resizing a campaign graphic for every platform simultaneously. Writing ad copy and generating a matching visual in one workflow.			
46	Figma — Claude Connected	Connected	Visuals
What it is: The industry-standard design tool launched 2016, now with an AI layer and a Claude MCP connector. Claude can access your Figma files, audit design systems, generate FigJam diagrams, and produce code from design specs — directly from the Claude conversation.			
How to use it: Connect Figma via Settings > Connectors. Ask Claude to review a design file for inconsistencies, generate a flowchart in FigJam, or produce front-end code from a component spec. For direct use, Figma AI generates layout variants, writes component copy, and translates design to code within the app.			
Use cases: Auditing a design system for spacing and colour inconsistencies automatically. Generating production-ready React components from a Figma design spec. Creating user flow diagrams in FigJam from a product description. Reviewing a design file for accessibility issues before handoff.			

47 Runway ML

AI Tool

Visuals

What it is: AI creative suite launched 2018, now the leading platform for AI video generation and editing. Gen-3 Alpha produces high-quality video from text or image prompts. Runway also offers background removal, object tracking, and video-to-video style transfer.

How to use it: Go to runwayml.com. Use Gen-3 Alpha by entering a text prompt or uploading a reference image. Specify camera motion, duration, and style. Use the video-to-video feature to apply a visual style to existing footage. Use Image to Video to animate a still image with motion.

Use cases: Producing a short brand or product video from a text description. Animating a product image for social media without a videographer. Applying a consistent visual style to existing footage. Creating concept video for a pitch or creative brief before production begins.

48 Claude — Image Analysis

Claude

Visuals

What it is: Upload any image to Claude — a photo, chart, diagram, wireframe, screenshot, or design — and ask Claude to analyse, describe, extract data from, or reason about it. Claude processes the full visual context, not just surface description.

How to use it: Upload the image in the Claude conversation. Ask a specific question rather than "describe this image" — "what does this chart show about Q3 performance", "what is wrong with this wireframe", "extract all the data from this table into a CSV". The specificity of the question determines the quality of the output.

Use cases: Extracting structured data from a table or chart in an image. Reviewing a wireframe or design and identifying UX problems. Understanding a complex diagram — architecture, process flow, org chart — quickly. Reading text in a screenshot when copy-paste is not available.

49 Ideogram

AI Tool

Visuals

What it is: AI image generation model launched 2023, known for superior text rendering inside images. Most image models produce illegible or distorted text — Ideogram produces readable, well-placed text inside generated visuals, making it the best tool for graphic design with typography.

How to use it: Go to ideogram.ai. Describe the image including any text you want in it. Use the style presets — Design, Illustration, Realistic, 3D. Specify the text content explicitly in the prompt and Ideogram renders it accurately in the image. Use Magic Prompt to enhance your description automatically.

Use cases: Creating social media graphics with readable text overlays. Generating poster designs with typography included. Producing mockups with accurate text placement for client review. Building promotional assets with readable offers, dates, and headlines embedded in the visual.

50	Kling AI	AI Tool	Visuals
What it is: AI video generation model launched by Kuaishou in 2024. Produces longer, more physically coherent videos than earlier models — up to 2 minutes. Known for realistic motion physics and consistent subject appearance across frames. Strong competitor to Runway for video generation.			
How to use it: Access at klingai.com. Enter a text prompt or upload a reference image for image-to-video. Set video duration and camera movement style. Use the professional mode for more control over motion and style. Generate multiple versions and select the best one for further editing.			
Use cases: Generating longer product demonstration videos from a brief. Creating realistic motion from a product or lifestyle image. Producing B-roll footage for a video project without a camera. Testing a video concept before investing in production.			
51	Whisper (OpenAI)	AI Tool	Audio
What it is: OpenAI's open-source speech recognition model launched 2022. Transcribes audio in 99 languages with high accuracy, handles accents and background noise well, and runs locally or via API. The most widely used transcription model behind dozens of third-party tools.			
How to use it: Use via the OpenAI API (model: whisper-1), deploy locally using the open-source weights, or access through any of the dozens of apps built on Whisper. Send an audio file and receive a timestamped transcript. For real-time use, integrate with a streaming audio pipeline.			
Use cases: Transcribing recorded meetings, interviews, and lectures accurately. Building a voice note to text pipeline for personal use. Powering the transcription backend for a custom application. Converting podcast recordings into text for repurposing as written content.			
52	Otter.ai	AI Tool	Audio
What it is: AI meeting transcription and note-taking platform launched 2016. Joins meetings on Zoom, Teams, and Google Meet, transcribes in real time, identifies speakers, generates summaries, and extracts action items. One of the earliest and most established meeting AI tools.			
How to use it: Connect Otter to your calendar and it joins meetings automatically. Access the transcript in real time during the meeting. After the meeting, review the AI-generated summary, action items, and key topics. Share with attendees or push to Notion, Slack, or CRM via integration.			
Use cases: Capturing everything said in a meeting without taking manual notes. Getting action items extracted automatically after a client call. Creating a searchable archive of all your meetings over time. Sharing a meeting summary with team members who could not attend.			

53	ElevenLabs	AI Tool	Audio
What it is: AI voice synthesis platform launched 2022. Produces the most realistic AI voices available — clones a voice from 60 seconds of audio, supports 29 languages, and generates speech with natural intonation, pacing, and emotion. The standard for professional AI voiceover.			
How to use it: Go to elevenlabs.io. Choose a pre-built voice or clone a voice by uploading a sample. Type or paste your script. Generate the audio. Use Voice Lab to adjust stability, clarity, and style. Use the API to integrate voice generation into your content pipeline.			
Use cases: Producing voiceover for video content without recording. Creating consistent brand narration across all content without re-recording. Building an AI voice for a podcast, audiobook, or course. Generating multi-language versions of a script from a single recording.			
54	Descript	AI Tool	Audio
What it is: AI-powered audio and video editing platform launched 2017. Edit audio and video by editing the transcript — delete words from the text and the audio is removed. Includes AI voice cloning (Overdub), filler word removal, studio sound enhancement, and AI-assisted cutting.			
How to use it: Upload your audio or video recording. Descript transcribes it automatically. Edit the transcript to edit the media — delete filler words, restructure sections, remove pauses. Use Studio Sound to clean up background noise. Use Overdub to re-record specific words with your AI voice clone.			
Use cases: Editing a podcast episode by editing text without touching a waveform. Removing all filler words from an interview recording in one click. Re-recording a mispronounced word using an AI clone of your voice. Cutting a 60-minute recording to a 20-minute edited version efficiently.			
55	Riverside.fm	AI Tool	Audio
What it is: Remote recording platform launched 2019 with AI production features. Records each participant locally and at high quality — no compression artefacts from video call encoding. AI features include transcription, clip generation, and automatic video layout.			
How to use it: Create a recording studio at riverside.fm. Share the link with guests. Each person records locally at full quality. After recording, download the separated audio tracks. Use the AI clip generator to find the best moments. Use the transcript to produce show notes.			
Use cases: Recording a podcast with remote guests at studio quality without a studio. Producing separate audio tracks for each guest for clean mixing. Generating highlight clips from a long conversation automatically. Getting a clean transcript from a high-quality recording for content repurposing.			

56	Granola	Connected	Audio
What it is: AI meeting notes tool launched 2024 that records your meetings without a visible bot joining the call. Records locally on your Mac, transcribes, and produces structured notes and action items. The Claude connector brings those notes into Claude for downstream use.			
How to use it: Install Granola on your Mac. It records your meetings automatically in the background without joining as a bot participant. After the meeting, review the AI-generated notes and action items. Connect to Claude via Settings > Connectors to reference meeting context in your Claude conversations.			
Use cases: Capturing sensitive client or board meetings without the visibility of a bot in the call. Getting structured action items from every meeting automatically. Using meeting context in Claude to draft accurate follow-up emails. Building a private archive of all your meetings and what was decided in them.			
57	Claude — Transcript Analysis	Claude	Audio
What it is: Paste any meeting transcript, interview recording, or call log and Claude extracts what matters — decisions made, action items, key themes, unanswered questions, and a structured summary. It reads the full transcript simultaneously and reasons about the whole conversation.			
How to use it: Paste the transcript into Claude. Be specific about what you need: "extract all action items and who owns them", "summarise what was decided vs what was left open", "identify the three most important things said in this conversation". The more specific the question, the more useful the output.			
Use cases: Extracting decisions and action items from a 90-minute meeting transcript in two minutes. Identifying the key themes across ten customer interview transcripts. Finding every time a specific topic came up across a series of meeting records. Preparing a follow-up email that accurately references what was said.			
58	Claude — Audio Content Planning	Claude	Audio
What it is: Describe your podcast, course, or audio content goals and Claude plans the content — editorial calendar, episode arc, titles, descriptions, interview questions, and promotional copy. It plans as a series with a logical progression, not as disconnected individual episodes.			
How to use it: Give Claude your show concept, your audience, your episode frequency, and the topics you want to cover. Ask it to produce a 12-episode calendar with titles, descriptions, and the key question for each episode. Then ask it to write the full brief for the next episode in production.			
Use cases: Planning a podcast season with a logical topic arc across 12 episodes. Generating episode titles and descriptions for a backlog of recorded episodes. Writing interview question sets tailored to a specific guest's background. Building an editorial calendar for an audio course or learning series.			

59	Adobe Podcast (Enhance Speech)	AI Tool	Audio
What it is: Adobe's AI audio enhancement tool launched 2022. Removes background noise, echo, and reverb from any voice recording in seconds — turning a laptop microphone recording into something that sounds like a professional studio. Free to use at podcast.adobe.com .			
How to use it: Go to podcast.adobe.com . Upload your audio file (MP3, WAV, M4A). Click Enhance Speech. Download the cleaned file in seconds. No account required for basic use. The AI identifies the voice, separates it from background noise, and reprocesses it at broadcast quality.			
Use cases: Cleaning up a recording made in a noisy environment — home office, cafe, travel. Making a laptop or phone microphone recording sound professional. Saving a recording that would otherwise be unusable due to background noise. Improving audio quality before adding it to a podcast, course, or video.			
60	Suno AI	AI Tool	Audio
What it is: AI music generation platform launched 2023. Generates complete songs with vocals, instruments, and lyrics from a text prompt. Produces music across all genres and styles — from pop to jazz to film score. The leading tool for AI-generated music production.			
How to use it: Go to suno.ai . Describe the song you want — genre, mood, tempo, topic, and style reference. Suno generates a complete song including vocals. Use Custom mode to provide your own lyrics. Extend the song, generate variations, or download the full audio file.			
Use cases: Creating background music for a video, podcast, or presentation without licensing costs. Producing a jingle or audio brand identity. Generating music for a game, app, or creative project quickly. Exploring musical concepts and arrangements without a music production background.			
61	Zapier	Connected	Automating
What it is: The leading no-code automation platform launched 2011. Connects 8,000+ apps through trigger-based workflows. The Claude MCP connector makes Zapier a bridge from Claude to everything it cannot natively reach — if there is no direct connector, Zapier fills the gap.			
How to use it: Connect Zapier via Settings > Connectors. Ask Claude to trigger an action across your connected apps: "create a Trello card from this task list", "send a Slack message when this condition is met". For direct Zapier use, build Zaps that trigger on events in one app and take actions in another.			
Use cases: Automating lead routing from a form submission to a CRM. Posting approved social content automatically on a schedule. Creating tasks in your project tool when a specific email arrives. Building a multi-step workflow that spans apps without a native connector between them.			

62	Notion AI	Connected	Automating
What it is: AI built into the Notion workspace, launched 2023. Drafts, summarises, translates, and extracts action items from content inside your Notion pages. The Claude connector extends this — letting Claude access and build on everything in your Notion workspace from outside it.			
How to use it: In Notion, press Space or /AI to activate. Give an instruction: summarise this page, write a first draft from these bullets, extract action items from these notes. Via the Claude connector, ask Claude to read specific Notion pages, create new pages, or synthesise content across your workspace.			
Use cases: Turning bullet-point meeting notes into a structured summary. Drafting a project brief from a set of research notes. Creating a weekly status update from multiple project pages. Asking Claude to synthesise everything in your Notion workspace about a specific topic.			
63	Gmail — Claude Connected	Connected	Automating
What it is: Google's email platform connected to Claude via MCP. Claude can search your email threads, summarise your inbox, draft replies with full conversation context, and identify messages that need action — without leaving the Claude conversation.			
How to use it: Connect Gmail via Settings > Connectors. Ask Claude: "find all emails from [client] about [project] and summarise the thread", "draft a reply to this email with the context from the full thread", "what emails need a response today". Claude reads your actual emails and responds with full context.			
Use cases: Getting a summary of a long email thread before responding. Drafting a reply that references what was said earlier in the conversation. Finding all emails about a specific topic without using search operators. Identifying which emails in your inbox need a response today.			
64	Google Calendar — Claude Connected	Connected	Automating
What it is: Google Calendar connected to Claude via MCP. Claude reads your schedule, identifies patterns, finds free time, and can audit your calendar against your stated priorities — flagging where your time does not match what you say matters.			
How to use it: Connect Google Calendar via Settings > Connectors. Ask Claude: "what does my week look like and where are the best blocks for deep work", "audit my recurring meetings and tell me which could be async", "find a free slot for a 90-minute focus block this week". Claude reads your real calendar and responds.			
Use cases: Identifying meeting-heavy weeks that need restructuring. Finding focus time blocks before committing to new work. Auditing recurring meetings that may have outlived their purpose. Understanding your time allocation patterns over the past month.			

65	Reclaim AI	AI Tool	Automating
What it is: AI calendar management tool launched 2020. Automatically schedules tasks, habits, and focus time in your Google Calendar — moving them around meetings dynamically to protect your priorities. Integrates with Asana, Jira, Linear, and Todoist.			
How to use it: Connect Reclaim to your Google Calendar. Add your tasks with priorities and time estimates. Set habits — daily focus time, exercise, lunch. Reclaim fills your calendar automatically, protecting these slots and adjusting when meetings move. Sync with your task manager to keep tasks and calendar in alignment.			
Use cases: Protecting daily focus time that keeps getting squeezed by meetings. Ensuring deep work blocks are scheduled before the week gets filled. Automatically rescheduling a task when a meeting conflict arises. Keeping a task manager and calendar in sync without manual updates.			
66	Motion	AI Tool	Automating
What it is: AI-powered project management and calendar tool launched 2019. Combines task management, project planning, and calendar scheduling. Its AI automatically schedules all your tasks into your calendar based on priority, deadline, and available time.			
How to use it: Add your tasks with deadlines and priorities. Connect your calendar. Motion's AI schedules all tasks into your available time blocks automatically. When you complete a task or a meeting changes, it reschedules everything else. Use the project view to plan multi-step work across a team.			
Use cases: Managing a heavy task load where manual scheduling takes too long. Ensuring high-priority deadlines are hit by automatically protecting time for them. Running a small team's workload across projects without a separate project management tool. Knowing at a glance what you will realistically complete this week.			
67	Asana — Claude Connected	Connected	Automating
What it is: Project management platform launched 2012, now connected to Claude via MCP. Claude can query project status, identify blocked tasks, surface overdue items, and prioritise work across multiple projects — through natural language rather than clicking through boards.			
How to use it: Connect Asana via Settings > Connectors. Ask Claude: "what tasks are overdue across all my projects", "which projects have the most blockers right now", "summarise the status of the [project name] project". Claude reads your actual Asana data and synthesises it.			
Use cases: Getting a cross-project status overview without clicking through every board. Identifying which tasks are blocking progress before a weekly review. Preparing a project status update for a stakeholder from live Asana data. Prioritising this week's work based on deadlines and dependencies across projects.			

68	Slack — Claude Connected	Connected	Automating
What it is: Team communication platform launched 2013, now connected to Claude via MCP. Claude can summarise channels, draft and preview messages before posting, and read message context before you respond — so you never reply without understanding what came before.			
How to use it: Connect Slack via Settings > Connectors. Ask Claude: "summarise what happened in #general today", "draft a response to [message] that references the context from the last three messages in that thread", "what are the open questions in the #product channel this week".			
Use cases: Catching up on a busy channel after time away without reading every message. Drafting a response that accurately references the conversation context. Understanding what decisions were made in a channel before joining a related meeting. Summarising multiple channel discussions for a weekly team update.			
69	Linear — Claude Connected	Connected	Automating
What it is: Engineering project management tool launched 2019, known for its speed and opinionated workflow. The Claude connector lets Claude read your engineering backlog, summarise sprint progress, generate release notes from completed tickets, and flag blockers.			
How to use it: Connect Linear via Settings > Connectors. Ask Claude: "generate release notes from all tickets completed this sprint", "which issues are blocked and why", "summarise our engineering velocity over the last four sprints". Claude reads your actual Linear data and produces the output.			
Use cases: Generating release notes from completed tickets in seconds rather than 30 minutes. Identifying blockers before a sprint review. Preparing an engineering progress update for a non-technical stakeholder. Understanding whether the current sprint is on track before the end of the week.			
70	Claude — Cowork Desktop Agent	Claude	Automating
What it is: Cowork is Claude's desktop agent — it controls your computer, executes file operations, opens applications, fills forms, and completes multi-step desktop workflows autonomously. It is not a chat interface — it acts on your actual computer across your real applications.			
How to use it: Access Cowork from the Claude desktop app. Describe the task you want done on your computer: "move all PDF files from Downloads to the Projects folder organised by date", "fill in this form with the data from this spreadsheet", "find all files related to [client] and create a summary". Cowork executes and reports back.			
Use cases: Automating repetitive file organisation tasks without writing scripts. Completing a multi-step data entry workflow across applications. Processing a batch of documents — renaming, moving, converting — without doing each manually. Executing a desktop workflow that crosses multiple applications without being the manual link between them.			

71	Duolingo Max	AI Tool	Learning
What it is: AI-powered tier of Duolingo launched 2023, using GPT-4 to add two new features: Explain My Answer (explains why an answer was right or wrong) and Roleplay (practices real conversations with an AI character). The AI layer on the most widely used language learning app.			
How to use it: Subscribe to Duolingo Max. Complete standard lessons as normal. When you get an answer wrong, tap Explain My Answer for a contextual explanation rather than just "incorrect". Use Roleplay to practice conversation scenarios — ordering food, asking directions — with an AI character.			
Use cases: Understanding why a specific grammatical construction is correct, not just that it is. Practicing a language conversation before a real-world situation. Getting contextual grammar explanations tied to the mistakes you actually make. Moving from passive recognition to active conversational ability.			
72	Khan Academy — Khanmigo	AI Tool	Learning
What it is: Khan Academy's AI tutor launched 2023, built on GPT-4. Khanmigo tutors students through problems using the Socratic method — asking guiding questions rather than giving answers. Available to students and teachers, it adapts to curriculum and learning level.			
How to use it: Access via khanacademy.org with a Khanmigo subscription. When working through a problem, click the Khanmigo button instead of checking the answer. It asks guiding questions to help you reach the solution yourself. Teachers use it to generate lesson plans, discussion questions, and feedback on student writing.			
Use cases: Working through a maths problem with guided hints rather than the answer. Getting a personalised explanation of a concept that a lesson did not make clear. Having a debate or Socratic dialogue with an AI to deepen understanding of a topic. Generating a lesson plan or worksheet as a teacher without building it from scratch.			
73	Coursera Coach	AI Tool	Learning
What it is: AI learning coach integrated into Coursera launched 2023. Answers questions about course material, explains concepts that were unclear in lectures, suggests which courses to take next, and helps learners apply what they are studying to their specific job context.			
How to use it: Access from inside any Coursera course. Ask the Coach questions about the lecture content, request a simpler explanation of a concept, or ask how a skill applies to your specific role. Use it to quiz yourself on the material before an assessment.			
Use cases: Getting a plain-language explanation of a technical concept after a confusing lecture. Quizzing yourself on course material before the graded assessment. Asking how a skill or framework applies to your specific industry or role. Getting a recommendation for the next course to take based on your learning goal.			

74	Claude — Personal Tutor	Claude	Learning
What it is: Claude tutors on any subject — explaining concepts at any level, checking understanding before moving on, adjusting explanations based on your answers, and connecting new ideas to what you already know. It is the most capable general-purpose AI tutor available.			
How to use it: Start by telling Claude your level and your goal: "teach me SQL from scratch, I can code in Python but have never used databases". Claude explains one concept at a time, asks a check-in question, and adjusts if you get it wrong. The more specific your level and goal, the better the tutoring.			
Use cases: Learning a technical skill — SQL, Python, statistics, financial modelling — from scratch with a tutor available at any time. Understanding a subject area you are entering professionally for the first time. Getting an explanation calibrated to your exact level rather than a generic course. Working through a specific concept that a course covered too quickly.			
75	Synthesis	AI Tool	Learning
What it is: AI learning platform launched 2021, originally built for SpaceX employees' children. Focuses on mathematical and computational thinking through collaborative problem-solving games. Uses AI to adapt difficulty and guide students through problems, not deliver lectures.			
How to use it: Access at synthesis.com. Students complete AI-adapted problem sets in simulation and strategy game formats. The AI tracks reasoning patterns, adapts difficulty in real time, and identifies specific thinking gaps. Parents review progress through the dashboard.			
Use cases: Building mathematical and logical reasoning skills in children beyond standard curriculum. Developing computational and strategic thinking through adaptive game-based challenges. Preparing children for advanced STEM coursework through reasoning-focused practice. Engaging students who are disengaged by traditional lecture-and-test formats.			
76	Claude — Quiz and Self-Testing	Claude	Learning
What it is: Claude builds and administers personalised quizzes on any topic. It adapts question difficulty to your performance, explains why answers are right or wrong, and diagnoses which areas need more study — all in a single conversation.			
How to use it: Tell Claude the topic and your level. Ask it to quiz you with one question at a time. After each answer, Claude explains the reasoning, not just the correct answer. Ask Claude to increase difficulty when you answer correctly, and to diagnose your knowledge gaps after 10 questions.			
Use cases: Testing your understanding of a topic before a high-stakes exam or interview. Identifying which specific areas within a subject you need to study more. Practising for certification exams in a conversational format. Verifying that you actually understand something rather than just recognising it.			

77	Perplexity — Learning Mode	AI Tool	Learning
What it is: Perplexity's AI search used as a learning tool — sourced, real-time answers to any question, with the ability to follow-up infinitely in the same thread. More useful than a textbook for current topics, professional knowledge, and questions textbooks do not cover.			
How to use it: Go to perplexity.ai. Ask a learning question: "explain how neural networks learn". Read the sourced answer. Ask follow-up questions to go deeper: "what is backpropagation", "why does this fail with vanishing gradients". Each answer is sourced, so you can verify and read further.			
Use cases: Understanding a concept from first principles with cited sources. Learning about a professional domain by asking increasingly specific questions. Researching a topic that is too current or too niche for a textbook. Building a mental model of a technical area through conversational questioning.			
78	Claude — Flashcard and Study Plan	Claude	Learning
What it is: Claude creates flashcards, study plans, and revision materials from any source content. It builds questions that test application, not just recall, and plans study sessions that use the time available efficiently with active practice built in.			
How to use it: For flashcards: paste the content and ask Claude to generate 15-20 flashcards with specific application questions. For a study plan: give Claude your topic, your current level, your timeline, and your available hours per week. It produces a week-by-week plan with specific tasks and practice exercises.			
Use cases: Converting a set of lecture notes or a textbook chapter into flashcards for active recall practice. Building a 6-week study plan for a certification exam with a realistic weekly structure. Creating application-focused questions that prepare you for how the knowledge is actually used. Planning a learning sprint when you have two weeks before a deadline.			
79	Brilliant	AI Tool	Learning
What it is: Interactive learning platform launched 2012, now with AI personalisation. Teaches STEM subjects — maths, science, computer science, data analysis — through interactive problem-solving rather than passive video watching. AI adapts the learning path based on your responses.			
How to use it: Go to brilliant.org. Select a course — maths, logic, data science, programming. Work through interactive lessons that require you to solve problems to advance, not just watch. The AI identifies your weaker areas and adjusts the content presented. Complete daily practice sessions to build consistent skill.			
Use cases: Building mathematical intuition through problem-solving rather than memorisation. Learning data science or programming through interactive exercises with immediate feedback. Developing logical reasoning and quantitative thinking for professional or academic application. Building a consistent learning habit with structured daily practice sessions.			

80	Socratic by Google	AI Tool	Learning
What it is: Google's AI learning app launched 2019. Point your camera at any problem — a maths equation, a science question, a history prompt — and Socratic explains how to solve it with step-by-step guidance, diagrams, and links to relevant explanations across subjects.			
How to use it: Open the Socratic app on your phone. Point the camera at the question or problem, or type it in. Socratic identifies the subject and concept, then provides a step-by-step explanation with visual aids. Use it to understand the method, not just find the answer.			
Use cases: Getting an immediate explanation of a maths problem you are stuck on. Understanding the concept behind a science question rather than just the answer. Working through homework problems with step-by-step guidance. Checking whether your understanding of a method is correct.			
81	Salesforce Einstein	AI Tool	Business
What it is: Salesforce's AI layer, launched as Einstein in 2016 — one of the earliest enterprise AI platforms. Embedded across Sales Cloud, Service Cloud, and Marketing Cloud, it provides predictive scoring, opportunity insights, automated data entry, and generative content across the CRM.			
How to use it: Access Einstein features within your existing Salesforce modules. Use Einstein Lead Scoring to prioritise the leads with the highest conversion probability. Use Einstein GPT to auto-generate email drafts and case summaries. Use Opportunity Insights to get AI warnings on deals at risk of slipping.			
Use cases: Prioritising the sales pipeline by AI-scored lead quality rather than rep intuition. Identifying at-risk deals before they are lost based on engagement patterns. Auto-generating case summaries and customer email drafts inside Service Cloud. Getting AI-recommended next best actions for a specific account.			
82	HubSpot AI — Claude Connected	Connected	Business
What it is: HubSpot's CRM and marketing platform launched 2006, now with an extensive AI layer and a Claude MCP connector. Claude can query your HubSpot pipeline, analyse deal velocity, review contact activity, and produce plain-language revenue intelligence from your live CRM data.			
How to use it: Connect HubSpot via Settings > Connectors. Ask Claude: "what is our pipeline value by stage", "which deals have had no activity in 14 days", "what is the average deal cycle for our enterprise segment". Claude reads your actual HubSpot data and gives you an answer, not a dashboard to interpret.			
Use cases: Getting a daily pipeline summary without logging into HubSpot. Identifying stalled deals before they fall out of the funnel. Understanding conversion rates by sales rep, region, or deal size. Preparing a revenue forecast for a board meeting from live CRM data.			

83	Gamma	AI Tool	Business
What it is: AI presentation and document tool launched 2022. Generates complete slide decks, documents, and webpages from a prompt or an outline — formatted, visually structured, and ready to present. The fastest way to go from an idea to a shareable presentation.			
How to use it: Go to gamma.app. Enter a topic or paste an outline. Gamma generates a complete deck with slides, images, and layout. Review and edit slides individually. Adjust the theme, swap images, and rewrite copy. Export as PDF or share a live link that can be updated.			
Use cases: Creating a pitch deck from a one-paragraph business description. Building an internal presentation from a set of meeting notes. Producing a visual document for a client that looks designed without using a designer. Getting from idea to shareable deck in under 15 minutes.			
84	Tome	AI Tool	Business
What it is: AI storytelling and presentation tool launched 2022. Focuses on narrative-first presentation design — helping you build the argument and story structure before the visual layer. Strong for strategic documents, investor narratives, and thought leadership pieces.			
How to use it: Go to tome.app. Describe your presentation goal and audience. Tome generates an outline first — review the narrative structure before generating slides. Add or remove sections. Let Tome generate visuals and layout. Refine individual slides with AI assistance.			
Use cases: Building an investor deck with a strong narrative arc rather than a slide list. Creating a strategic document that argues a position rather than just presents data. Producing a thought leadership piece that reads as a story. Preparing a board presentation with a clear logical flow from problem to recommendation.			
85	Claude — Business Strategy	Claude	Business
What it is: Claude applies strategic frameworks to real business situations — not as templates but as reasoning tools. Describe a situation, a decision, or a challenge and Claude diagnoses the real question, identifies assumptions, and produces a recommendation with clear logic.			
How to use it: Give Claude the full context of the business situation — not just the question but the constraints, the history, and what you have already tried. Ask it to apply a specific framework (Porter's Five Forces, Jobs to Be Done, SWOT) or to identify which framework fits. Then ask for a recommendation and challenge it.			
Use cases: Working through a go-to-market decision with structured analysis. Identifying the real bottleneck in a growth problem rather than treating symptoms. Preparing the strategic argument for a board presentation. Stress-testing a business plan by asking Claude to argue against it.			

86	Outreach — Claude Connected	Connected	Business
What it is: Sales engagement and revenue intelligence platform launched 2014, now connected to Claude via MCP. Claude can surface sequence performance, deal risk signals, rep activity patterns, and account engagement data from your live Outreach data in plain language.			
How to use it: Connect Outreach via Settings > Connectors. Ask Claude: "which sequences have the highest reply rate", "which accounts have had no activity in the last 21 days", "identify the deals most at risk of slipping this quarter". Claude reads your live Outreach data and produces an intelligent summary.			
Use cases: Identifying which sales sequences are working and which to retire. Surfacing at-risk deals before the end of quarter. Understanding rep activity patterns without reviewing individual call logs. Preparing a revenue risk analysis for a sales leadership meeting.			
87	Perplexity — Competitive Research	AI Tool	Business
What it is: Perplexity used specifically for real-time competitive and market intelligence. Its sourced, current answers make it the fastest tool for researching competitors, industry trends, and market developments without spending hours on manual research.			
How to use it: Go to perplexity.ai. Ask competitive research questions: "what are the main competitors to [product] and what do their customers complain about", "what is the pricing model of [company]", "what has [competitor] launched in the last six months". Each answer is sourced and current.			
Use cases: Researching a competitor before a proposal or pricing conversation. Understanding market trends before a strategic planning session. Building a competitive landscape overview for a board or investor presentation. Monitoring a competitor's recent moves before a product launch.			
88	G2 — Claude Connected	Connected	Business
What it is: B2B software review marketplace launched 2012, now connected to Claude via MCP. Claude can query verified buyer reviews, competitive intelligence, and intent data from G2 — asking what customers actually say about your product and competitors, not what the marketing claims.			
How to use it: Connect G2 via Settings > Connectors. Ask Claude: "what are the most common complaints about [competitor] on G2", "how does our review sentiment compare to [competitor]", "which companies are researching alternatives to [product] right now". Claude reads verified G2 data, not web hearsay.			
Use cases: Understanding your competitive position through buyer perception rather than analyst reports. Identifying product gaps from what competitors' customers complain about. Monitoring which accounts are showing intent to switch. Preparing a competitive battle card from verified review data.			

89

Claude — Proposal Writing

Claude

Business

What it is: Claude writes proposals, pitches, and strategic documents — opening with the client's situation rather than your credentials, structuring the argument from their perspective, and producing a document that is persuasive because it demonstrates understanding.

How to use it: Give Claude the client context, their problem, what you are proposing, and the decision-maker's likely priorities. Ask Claude to write the proposal opening with their situation first. Review and ask Claude to strengthen the weakest section, tighten the ask, or adjust the tone.

Use cases: Writing a client proposal that starts with their problem rather than your history. Producing a pitch document for a partnership that frames the value from the partner's perspective. Writing an investment memo that argues the case rather than describes the company. Creating a board paper that anticipates objections and addresses them.

90

Claude — Financial Planning

Claude

Business

What it is: Claude structures financial analyses, reviews financial models, and reasons about business finance decisions. It checks model logic, identifies flawed assumptions, calculates scenarios, and explains financial concepts in plain language for non-finance audiences.

How to use it: Give Claude your financial model, your scenario description, or your question. Ask it to check the model logic, identify the assumptions most likely to be wrong, or calculate a specific scenario. For presentations, ask Claude to explain the financial picture in language the audience will understand.

Use cases: Reviewing a financial model for logic errors before presenting it. Building a scenario analysis that shows the impact of key assumption changes. Explaining a P&L or cash flow statement to a non-finance co-founder or team member. Structuring a financial narrative for an investor conversation.

91

AutoGPT

AI Tool

Agents

What it is: One of the first public autonomous AI agent experiments, launched March 2023. AutoGPT chains GPT-4 calls to complete multi-step goals without human input at each step — the earliest demonstration that LLMs could plan and execute sequences of actions, not just answer questions.

How to use it: Deploy via the AutoGPT GitHub repository. Define a name, role, and goal for the agent. AutoGPT breaks the goal into tasks, executes them (web search, file writing, code execution), reviews results, and iterates. Best for experimentation — not yet production-reliable for complex tasks.

Use cases: Understanding how autonomous AI agents work by running a real example. Automating a research-and-summarise task that runs without step-by-step human guidance. Exploring what AI agents can and cannot reliably do before building production agent workflows. Prototyping an agentic workflow before committing to a more robust infrastructure.

92	LangChain	AI Tool	Agents
What it is: The most widely adopted framework for building LLM-powered applications, launched 2022. LangChain provides the components — chains, agents, memory, tools — to build production AI applications that go beyond a single prompt-response interaction.			
How to use it: Install via pip (langchain). Build chains that sequence LLM calls and tool use. Use LangChain agents to give an LLM access to tools — web search, calculators, databases — and let it decide which to call. Use LangChain memory to maintain conversation state across sessions.			
Use cases: Building a custom AI assistant with access to your internal data sources. Creating a multi-step pipeline that researches, synthesises, and produces a formatted report. Building a chatbot with memory that recalls previous conversations. Connecting an LLM to a database, API, or file system in a production application.			
93	n8n	AI Tool	Agents
What it is: Open-source workflow automation platform launched 2019. Self-hostable alternative to Zapier with native AI nodes — connect LLMs, embedding models, and vector databases directly in workflow builds. Strong for technical teams who want automation infrastructure they control.			
How to use it: Deploy n8n locally or via cloud. Build workflows by connecting nodes — triggers, actions, AI models, databases. Use the AI Agent node to give Claude or GPT-4 access to tools inside an n8n workflow. Trigger workflows from webhooks, schedules, or manual execution.			
Use cases: Building a self-hosted AI automation pipeline that processes incoming data. Creating a workflow that uses an LLM to classify, route, and respond to incoming emails or tickets. Connecting AI reasoning to internal databases and APIs in a production workflow. Running AI workflows on sensitive data that cannot leave your own infrastructure.			
94	Claude — Agentic Mode	Claude	Agents
What it is: In agentic mode, Claude plans and executes multi-step tasks — searching the web, reading documents, writing code, and taking actions across connected tools in sequence to complete a goal that requires more than one exchange.			
How to use it: For agentic tasks, give Claude a clear goal rather than a single question: "research the top five competitors in X market and produce a comparison report". Claude will plan the steps, use available tools (search, connectors, code), execute them in sequence, and produce the final output.			
Use cases: Running end-to-end research that requires multiple searches, synthesis, and a formatted output. Executing a content production workflow — research, draft, edit, format — in one instruction. Completing a multi-step analysis that requires retrieving data, processing it, and writing a report. Handling a task that would normally require three separate Claude conversations.			

95	Claude — Managed Agents	Claude	Agents
What it is: Claude Managed Agents, launched April 2026, are hosted long-running agents that execute tasks in the background with their own tools, OAuth credentials, and compute. They persist beyond a conversation — working on complex tasks while you do other things.			
How to use it: Initiate a Managed Agent task from the Claude interface or API. Define the goal, the tools it should use, and any constraints. The agent runs in the background — you receive a notification when it completes or needs a decision. Review the output and either accept or redirect.			
Use cases: Running a comprehensive research project that takes hours to complete properly. Executing a multi-source data synthesis task that runs overnight. Setting an agent to monitor a set of sources and report when something significant changes. Completing a large content production task — multiple articles, multiple formats — that runs while you sleep.			
96	Zapier — AI Workflow Steps	Connected	Agents
What it is: Zapier with Claude as an intelligent step in a multi-app workflow. Where a standard Zapier Zap routes based on fixed rules, adding Claude as a step means the routing, classification, or content generation at that step is intelligent — it understands the content, not just its format.			
How to use it: Build a Zap with Claude as an action step. Use Claude to classify an incoming support ticket and route it. Use Claude to summarise an email and write a draft reply. Use Claude to score a lead based on the information in a form submission. Claude receives the input from the previous step and produces output for the next.			
Use cases: Routing support tickets based on Claude's understanding of the issue, not keyword matching. Generating a personalised response to a lead based on the content of their form submission. Classifying incoming data (emails, feedback, applications) and tagging it accurately before it enters a database. Adding intelligence to a Zapier workflow that currently misroutes edge cases.			
97	Claude Code — Autonomous	Claude	Agents
What it is: Claude Code in headless or autonomous mode completes large, complex coding tasks without step-by-step human direction. It reads the codebase, plans the implementation, writes code, runs tests, fixes failures, and iterates until the task is complete.			
How to use it: Run Claude Code with the <code>--headless</code> flag or set autonomy level in the Claude Code settings. Define a clear engineering task: "implement the user authentication flow as specified in the PRD". Claude reads the spec and existing code, plans the implementation, writes it, and runs the test suite, repeating until all tests pass.			
Use cases: Implementing a well-defined feature from a specification without engineer oversight at each step. Running a large-scale refactor across a codebase autonomously. Completing a database migration task that requires consistent changes across many files. Writing a full test suite for an existing module without manual test authoring.			

98	n8n + Claude	Connected	Agents
What it is: n8n with Claude integrated as an AI reasoning node — the combination of n8n's flexible workflow infrastructure and Claude's reasoning capability. Claude handles the intelligent steps; n8n handles the connections, scheduling, and cross-app data movement.			
How to use it: In n8n, add an HTTP Request node pointing to the Anthropic API, or use the native Claude node if available. Pass the output of a previous node as Claude's input. Claude processes it — classifying, summarising, generating, deciding — and its output feeds the next node. Host the workflow on your own infrastructure for full data control.			
Use cases: Building an AI-powered email triage system that classifies and routes incoming mail. Creating a content pipeline that fetches a topic, researches it, drafts an article, and posts it on a schedule. Processing incoming data — form submissions, webhook events — with AI reasoning before storing. Running a private AI automation workflow on sensitive data without third-party cloud exposure.			
99	Claude — Tool Use via API	Claude	Agents
What it is: Claude's function calling (tool use) capability lets Claude call external APIs, query databases, and take actions during a conversation. Developers define the available tools; Claude decides when and how to call them based on the task at hand.			
How to use it: Define your tools as JSON schemas in the API call. Claude reads the tool definitions and decides when to call them during the conversation. When Claude calls a tool, you execute it on your side and return the result. Claude incorporates the result and continues reasoning. Build multiple tools for Claude to choose between.			
Use cases: Building an AI assistant that can look up customer records, check inventory, or run a calculation on demand. Creating a conversational interface to an internal database or API. Building a multi-tool agent where Claude decides which tool to use for each step. Connecting Claude to any external system that has an API.			
100	Claude — Custom MCP Connector	Claude	Agents
What it is: Build your own MCP connector to give Claude access to any proprietary system, internal tool, or API that is not in the public directory. The connector follows the open MCP standard and works across Claude.ai, Claude Desktop, Claude Code, and Cowork.			
How to use it: Follow Anthropic's MCP server documentation at claude.com/docs/connectors. Define your tools as MCP functions. Deploy as a remote server (HTTPS) or local extension. Connect via Settings > Connectors using your server URL. Your tools are now available to Claude in every conversation and every Claude product.			
Use cases: Connecting Claude to your internal CRM, ERP, or data warehouse that is not in the public connector directory. Building a custom integration between Claude and a proprietary API. Making an internal tool accessible to Claude across your entire organisation. Creating a Claude connector for a product you are building so your users can connect their Claude to it.			

The stack is the strategy.

Know the tools. Build the workflow. Own the outcome.
